Lab 5 - Creating a Pull Request

This exercise extends the previous one on branching.

- cd into your FlaskAppBasic folder (containing your fork of the qa-apprenticeships/FlaskAppBasic project)

- Create and checkout a new branch called bug-fix-1

- Edit the app.py file, and insert your name somewhere in the return statement string within the hello_world() function

- Stage, commit and push the change to a branch in GitHub also called bug-fix-1

- In GitHub website, create a new pull request, to request that the changes made in your bug-fix-1 branch be pulled into the master branch of the upstream repository (qa-apprenticeships/appflaskbasic)

  This means that the "base repository" should be the master branch of qa-apprenticeships/flaskappbasic, and the "head repository" should be the bug-fix-1 branch of your fork of the flaskappbasic project.

- Let the tutor know when you've done this, and we can move onto the next stage, where the tutor will review the pull requests, and decide which one(s) to accept and/or reject (or maybe even send back to you for further work...)
