Lab 5 - Creating a Pull Request

The following practice can be performed entirely on the GitHub website. Refer to the Pull Request section of the Learner Guide to see how to do a Pull Request on GitHub.

Create a new feature branch on a GitHub project you've already made (or create a new project, if necessary). Make some changes on this feature branch, then create a pull request to have the new feature merged into the project.

Next, fork a repository from someone in your class (any repository will do). Make some changes in this forked repository and create a pull request to have your feature merged into the original project.
